

## (Unit-4)

Page No. \_\_\_\_\_

Date: \_\_\_\_\_

Array :- An array is a collection of similar type of data elements, that are referenced by a common name.  
one variable : Capable of storing multiple values.

### Characteristics of Array :-

- \* 1. All Elements within an array must be of the same data type. This could be int, float, char, or any other valid C data type.
- \* 2. All the elements of an array occupy a set of contiguous memory allocations, making it efficient for accessing and manipulating elements.
3. The size of an array is fixed at the time of declaration & can't be changed dynamically during program execution.
4. Each Element in an array is identified by a Unique Index, starting from 0.
5. C supports multidimensional arrays, which can be used to represent matrices or tables. Each index has its own dimension.

Ex - 1Dimensional Array. (Store elements in a single row).  
`int numbers[5] = {10, 20, 30, 40, 50};`

→ 2 D Array. (Store elements in rows & columns).  
`int matrix[3][2] = {{1, 2}, {3, 4}, {5, 6}}`

2 subscript

Order of Execution for iteration:  
 initialization  $\rightarrow$  cond  $\rightarrow$  operation  $\rightarrow$  updation

Page No.: \_\_\_\_\_  
 Date: \_\_\_\_ / \_\_\_\_

## ↳ Multidimensional Arrays

Can have more than two dimensions.

array :-	<table border="1" style="display: inline-table; vertical-align: middle;"> <tr><td>0</td><td>1</td><td>2</td><td>3</td><td>4</td><td>5</td><td>6</td><td>7</td><td>8</td><td>9</td></tr> </table>	0	1	2	3	4	5	6	7	8	9	2004      2012      2040
0	1	2	3	4	5	6	7	8	9			
		$2000 + 4 * 2 = 2008$ $2000 + \frac{4 * 5}{\downarrow} = 2012$										

\* Formula to calculate :- Base address +  $\frac{\text{data size} * \text{No. of Element}}{\text{Type Size}}$   
 the address of any element in array.

Variable declaration  $\rightarrow$  memory allocation.

index/ subscript	0	43	studMark [0]	starting from 0 instead of 1
1	70	"	[1]	
2	56	"	[2]	
3	81	"	[3]	
.....	.....	.....	.....	
999	97	studMark [999]	array's name.	
			memory storage	

Arrays are a powerful tool for organizing and managing data efficiently.

Array declaration

array-element data type array name [array-size];

e.g. float

char

int, etc.

Static Memory allocation :- It is the type of allocation in which the Compiler allocates memory for variables at compile time. This means the memory size and lifetime of these variables are fixed and known beforehand.

Dynamic Memory allocation :- It allows programmers to allocate memory at run time, providing more flexibility in managing memory usage.

The `malloc()` & `calloc()` functions are used to allocate memory while the `free()` function is used to deallocate it.

### Static Allocation

- ↳ Simpler to use.
- ↳ More efficient for fixed-size data structures.
- ↳ Less flexible.
- ↳ Occurs at compile time.
- ↳ Exists throughout the program's execution or until the function returns.
- ↳ Usually on the stack.

### Dynamic Allocation

- ↳ Can be less efficient due to overhead of memory allocation & deallocation.
- ↳ More flexible for variable-sized data structures.
- ↳ Occurs at run time.
- ↳ Exists until explicitly deallocated using `free()`.
- ↳ Storage on the heap.

NOTE: Array index use indices from 0 to 999 to access the elements of the array.

## Array Initialization & declaration

data type - array name [ . size ] = { val1, val2, ... valn } ;

char chvowel [ 6 ] = { 'a', 'e', 'i', 'o', 'u', '\0' } ;  
 ↓  
 memory allocate  
 after allocating, it's our choice whether we place value or not.  
 ↓  
 Null character

String - Sequence of Characters.

char chvowel [ 6 ] = "aeiou" ;

char chName [ ] = "Mr. Dracula" ;

→ stored as a seq. of char.

Char chName [ 0 ] = M

Char chName [ 1 ] = r

Char chName [ 2 ] = .

Char chName [ 3 ] = white blank.

char chName [ 10 ] = a. Dracula

Taking 10 integer input from user & store them in an array & find the sum of all numbers stored in array.

#include < stdio.h >

int main()

int i, Sum 0, arr [ 10 ] ;

for ( i = 0 ; i < 10 ; i ++ )

scanf ( "%d" , & arr [ i ] ) ;

for ( i = 0 ; i < 10 ; i ++ )

Sum + = arr [ i ] ;

printf ( " Sum of input integers" )

is %d \n" , Sum ) ;

return 0 ;

```
#include <stdio.h>
```

```
int main()
```

```
int i, j, x, arr[10];
```

```
printf ("Enter 10 integer numbers");
```

```
for (i = 0; i < 10; i++) {
```

```
scanf ("%d", &arr[i]);
```

```
}
```

```
for (j = 0; j < 9; j++) {
```

$x = arr[i]$ ;  
assign

```
for (j = i + 1; j < 10; j++) {
```

if ( $x == arr[j]$ )

```
printf ("%d nos appeared more than once", 2);
```

```
}
```

```
return 0;
```

```
}
```

$M = [0] \text{ arr[1..12] work}$   
 $st = [2] \text{ arr[1..17] work}$   
 $s = [3] \text{ arr[1..12] work}$   
 $\text{Held state} = [4] \text{ arr[1..12] work}$

## 2D Arrays.

- ↳ A two dimensional array has 2 subscripts / indexes.
- ↳ 1<sup>st</sup> refers to the row & second refers to the column.

Declaration : data type array name [ 1<sup>st</sup> dimension size ][ 2<sup>nd</sup> D. size ]

Eg., int xInteger [3][4];

(++j; i > j) float matr[10][25];

i [j][m] = + m;

(we must know or declare that what type of approach we are using like row wise or column wise.)

Search  
Technique

no order req.

order req.

(ascending or descending)

```
#include <stdio.h>
```

```
#define ROW 5
```

```
#define COL 4
```

```
int main (void) {
```

```
    int i, j;
```

```
    double total;
```

```
    int marks [ROW][COL] = {10, 23, 31, 11, 20, 43, 21, 21, ...};
```

```
    for (i=0; i<ROW; i++) {
```

```
        total = 0.0;
```

```
        for (j=0; j<COL; j++)
```

```
            total += marks[i][j];
```

```
    printf ("Average of student %d is %.f\n", i, total/4.0);
```

For array storing string

```
char Name [6][10] = {"Mr. Bean", "Mr. Bush", "Nicole",  
                     "Kidman", "Arnold", "Janet"};
```

Searching  
Technique

Searching operation and sorting operation.

Sequential / linear search for searching the particular element in a given sequence.

We have to search the element linearly or one by one from the very first index i.e., 0

Binary search / Internal Search

order is  
req.  
(ascending or  
descending)

Best Case where we find the element in least operations. Based on divide & conquer mtd.

10	5	15	6
s.	adjacent element.		

for ( $i \rightarrow 0$  to  $n-1$ )  
if ( $\text{Key} == a[i]$ )

$a[6] [8 | 9 | 0 | 7 | 5 | 40 | 31]$   
0 1 2 3 4 5

Key  $\Rightarrow 40$

Ex:-  $a[] [1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9]$

(+ 1, 10, 2, 3, 4, 5, 6, 7, 8, )  
Left  $\downarrow$  Mid  $\downarrow$  Right

→ divide in two halves & search until element is found.

→ for finding mid, use floor & ceiling fun if no. is in decimal.

→ prerequisites Cond'. The array must be sorted in either ascending or descending order.

middle element =  $(\text{first} + \text{last}) / 2$

$$0 + 8 / 2 = 4 \text{ mid term}$$

while ( $\text{first} \leq \text{last}$ )

middle < Element  
first = middle + 1 (RHS)

last = middle - 1 (LHS)

(Value of element is equal to middle element)

Element to be found 72

$m-1$	$m$	$m+1$
9	20	25
↓	↓	↓
1	2	3
↓	↓	↓
4	5	6
↓	↓	↓
7	8	9
↓	↓	↓
1st	mid	last
$(m-1)$	$m$	$(m+1)$
Cond'	Cond'	Cond'

middle > Element

last = middle - 1 (LHS)

①  
②  
③  
④

Best case in Binary is when we find element at mid & worst will be when it is present at either end of it.

Sorting → Rearrangement of elements of an array in a specific or logical order, typically in ascending or descending order.

Common Sorting algorithm are as follows :

1. Bubble Sort.

- ↳ Each element is compared with its adjacent elements & swaps them if they are in the wrong order.
- ↳ Simple to implement but inefficient for large datasets.

↳ Ex :- Initial      

5	3	8	4	6
---	---	---	---	---

      Unsorted array

Step 1.	<table border="1" style="display: inline-table; vertical-align: middle;"><tr><td>5</td><td>3</td><td>8</td><td>4</td><td>6</td></tr></table>	5	3	8	4	6
5	3	8	4	6		
Step 2.	<table border="1" style="display: inline-table; vertical-align: middle;"><tr><td>5</td><td>5</td><td>8</td><td>4</td><td>6</td></tr></table>	5	5	8	4	6
5	5	8	4	6		
Step 3.	<table border="1" style="display: inline-table; vertical-align: middle;"><tr><td>3</td><td>5</td><td>8</td><td>4</td><td>6</td></tr></table>	3	5	8	4	6
3	5	8	4	6		
Step 4.	<table border="1" style="display: inline-table; vertical-align: middle;"><tr><td>3</td><td>5</td><td>4</td><td>8</td><td>6</td></tr></table>	3	5	4	8	6
3	5	4	8	6		
Step 5.	<table border="1" style="display: inline-table; vertical-align: middle;"><tr><td>3</td><td>5</td><td>4</td><td>6</td><td>8</td></tr></table>	3	5	4	6	8
3	5	4	6	8		

Ques!

- ① Print Transpose of a Matrix
- ② Add two matrix using multi-dimensional arrays.
- ③ Multiply 2 " " " "
- ④ Find the sum of each element in Matrix

## Address Calculation

Page No.

Date

```
#include <stdio.h>
void main () {
    static int array [10][10];
    int i, j, m, n;
    printf ("Enter the order of Matrix");
    scanf ("%d %d", &m, &n);
    printf ("Enter the Coefficients of matrix");
    for (i = 0; i < n; ++i) {
        for (j = 0; j < n; ++j) {
            scanf ("%d", &array [i][j]);
        }
    }
}
```

```
printf ("The given matrix is \n");
for (i = 0; i < m; ++i) {
    for (j = 0; j < n; ++j) {
        printf ("%d", array [i][j]);
    }
    printf ("\n");
}
```

```
printf ("Transpose of matrix is \n");
for (j = 0; j < n; ++j) {
    for (i = 0; i < m; ++i) {
        printf ("%d", array [i][j]);
    }
    printf ("\n");
}
```

```
}
```

## 2. Selection Sort

↳ finds the minimum element in the unsorted part of the array & swaps it with first element.

$a[0]$	<table border="1"> <tr> <td>9</td> <td>5</td> <td>11</td> <td>16</td> <td>3</td> <td>1</td> </tr> </table>	9	5	11	16	3	1
9	5	11	16	3	1		
	Small Small Small Small (fixed)						

Small      Small      Small      Small (fixed)

0      1      2      3      4      5

Max no. index

$(n-1)$

small. =  $a[0]$

ismall = 0;

\* This method doesn't compare with adjacent elements.

if ( $a[j] < \text{small}$ ) {

    small =  $a[j]$ ;

    ismall =  $j$ ;

Sorted	1	5	11	16	3	9
	0	1	2	3	4	5

swap

$0 \rightarrow (n-1)$

1	3	11	16	5	9
---	---	----	----	---	---

$= n - 1 - 0 + 1$

1	3	5	16	11	9
---	---	---	----	----	---

$\rightarrow (n-2)$

1	3	5	9	11	16
---	---	---	---	----	----

$= n - 2 - 0 + 1$

The array is now sorted: [1, 3, 5, 9, 11, 16]

Strings :-

It's a sequence of characters treated as a group

- ↳ Any group of characters defined b/w double quotes marks is a string Constant.
- ↳ End of string is indicated by a delimiter, the zero character '\0'.  
→ Imputed by the Compiler.

String literals values are represented by sequences of characters b/w double quotes.

"a" v/s 'a'

• String

• needs 2 bytes

• Char

• needs 1 byte

Duplicate String literals each string literals in a program is sorted in a diff. locations.

Declaring & Initializing String Variables.

char string\_name [Size];

char str1 [6] = "Hello";

char str2 [] = "Hello";

char str4 [6] = {'H', 'e', 'l', 'l', 'o', '\0'};

str1 = str2;

not allowable, but we can copy the contents of str1 to str2.

predefined  
func.

29/11/20

Q: Why do we need a terminating NULL character?

In C programming, the terminating NULL character, represented as '\0', is an essential element for defining & manipulating strings. It serves as a sentinel, marking the end of a character sequence. This seemingly simple concept plays a crucial role in various string operations & library functions.

format specifier '%s'

printf (" %s ", Name);

O/P - /\* | Nehal \*/

## String Manipulation

predefined func. points	strlen ("Name of string") strcpy (dest., source) strcmp (String 1, String 2) strlstr strcat()	string.h header file
-------------------------------	---	-------------------------

29/11/24

Program to find length of string using 'for' loop.

```
#include < stdio.h > < d.ait2 > shubham #
#define MAX_SIZE 100 #include "string.h"
int main ()
{
  char text [MAX_SIZE]; /* declares a string of size 100 */
}
```

```

int i;
int count = 0;
printf ("Enter any string:");
scanf ("%s", text); → not written b/c address of 1st element
of array is passed automatically as argument
/* iterate till the last character of string */
for (i=0; text[i] != '\0'; i++)
{
    Count++;
}
printf ("length of string %s = %d", text, Count);
return 0;
}

```

O/P → Enter any String = Urmil  
Length of String = 6

U	r	m	i	'\0'
0	1	2	3	4

\* gets(text); It allows us to Enter multiword string separated by whitespaces. But it shows some warning (not safe to use).

\* Program to Copy one string to another string.\*

```

#include < stdio.h >
#define MAX_SIZE 100
int main()
{
    char text1 [MAX_SIZE];
    char text2 [MAX_SIZE];
    int i;
}

```

```

    printf ("Enter any string: ");
    gets (text1);
    for (i = 0; text1[i] != '\0'; i++)
    {
        text2[i] = text1[i];
    }
    text2[i] = '\0';
    printf ("first string = %s\n", text1);
    // ("Second");
    printf ("Total character count = %d\n", i);
    return 0;
}

```

Element arrays  
 are the  
 address.

consider  
 blank space  
 & will be  
 terminated  
 when '\0'  
 is found

/\* Prgm to convert string to uppercase \*/

```

#include <stdio.h>
#define MAX_SIZE 100
int main ()
{
    char str [MAX_SIZE];
    int i;
    printf ("Enter your text: ");
    gets (str);
    for (i = 0; str[i] != '\0'; i++)
    {
        if (str[i] >= 'a' & & str[i] <= 'z')
            str[i] = str[i] - 32;
    }
    printf ("Uppercase string: %s", str);
    return 0;
}

```

/\* C program to concatenate two strings using 'while' loop \*/

```
#include < stdio.h >
void concatenateStrings (char str1(), char str2()) {
    int i = 0, j = 0;
    while (str1(i) != '\0') {
        i++;
    }
    while (str2(j) != '\0') {
        str1(i) = str2(j);
        i++;
        j++;
    }
    str1(i) = '\0';
}
```

if (str1(i) == '\0')

int main () {

char str1(100), str2(100);

printf ("Enter the first string : ");

fgets (str1, sizeof(str1), stdin);

printf ("Enter the second string : ");

fgets (str2, sizeof(str2), stdin);

int len1 = 0;

while (str1(len1) != '\0') {

if (str1(len1) == '\n') {

str1(len1) = '\0';

break;

len1++;

int len2 = 0;

while (str2(len2) != '\0') {

```

if (str2 (len2) == '\n') {
    str2 (len2) = '0';
    break;
}
len2++;
ConcatenatingStrings(str1, str2);
printf ("Concatenated strings : %s\n", str1);
return 0;
}

```

O/P  $\Rightarrow$  : Enter the first string : Hello  
       " , second : World  
       Concatenated strings : HelloWorld.

$\hookrightarrow$  Tower of Hanoi
